

# FinSage v2.0 技术文档

## Multi-Agent Financial Portfolio Management System

### 多智能体金融组合管理系统

文档版本: 2.0

最后更新: 2024年12月

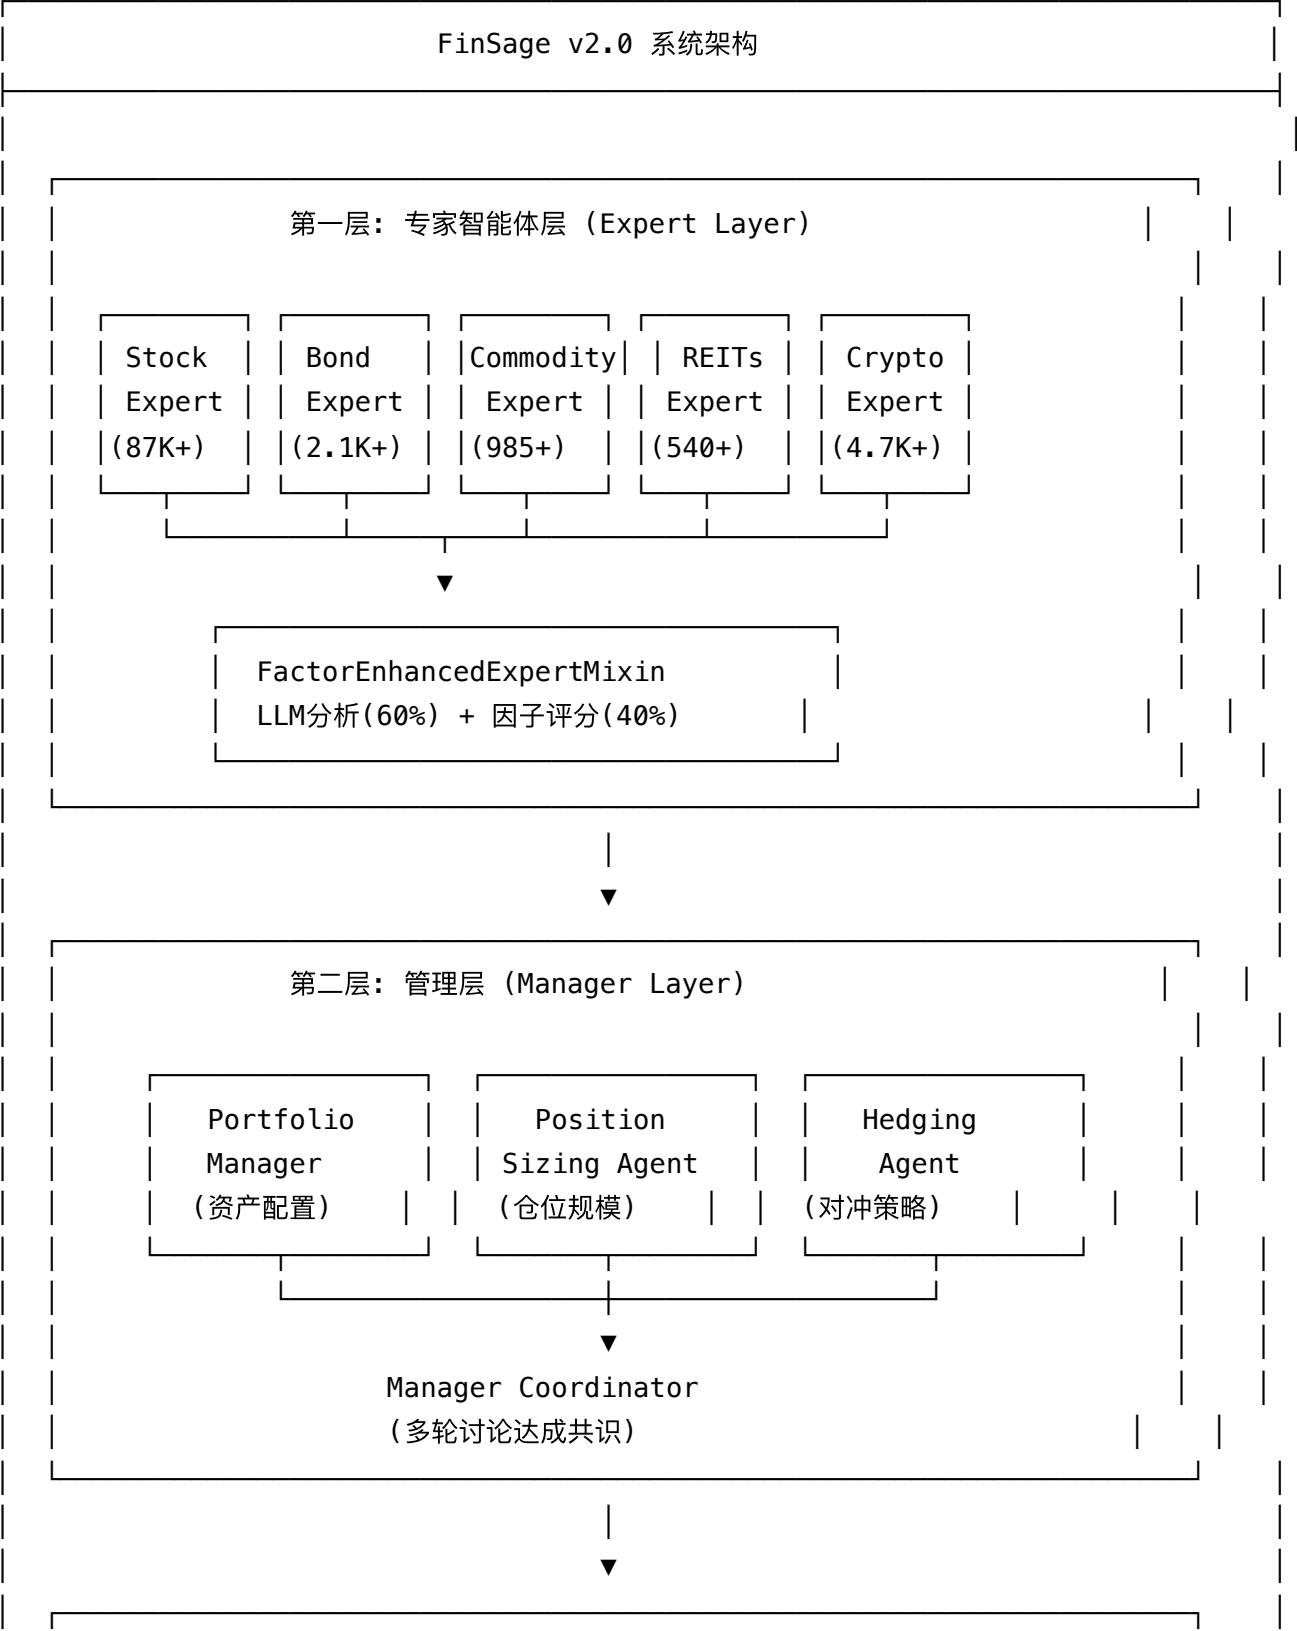

适用版本: FinSage v2.0+

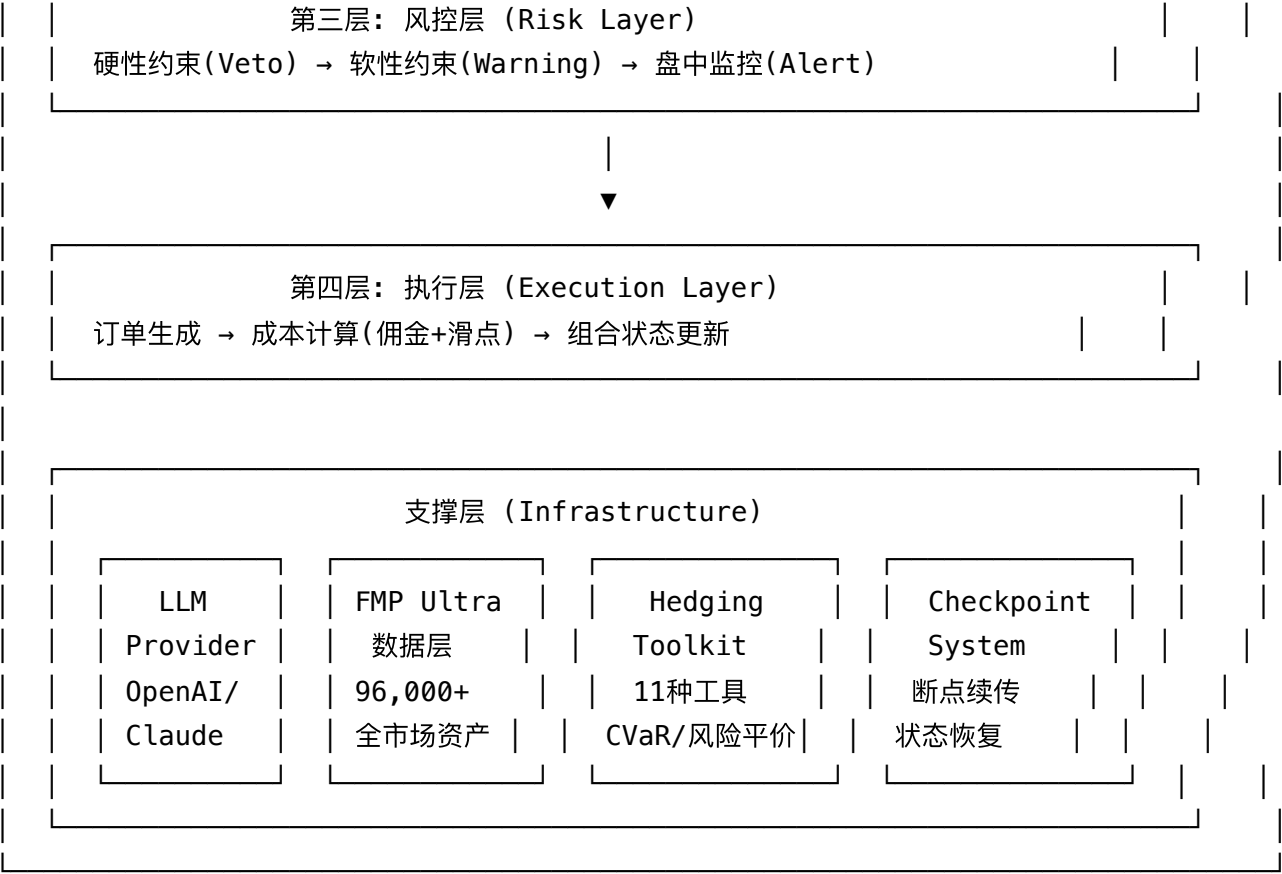

## 目录

- 系统架构总览
- 核心配置系统
- 专家智能体层
- 管理层智能体
- 因子增强系统
- 对冲工具包
- 数据层架构
- 附录

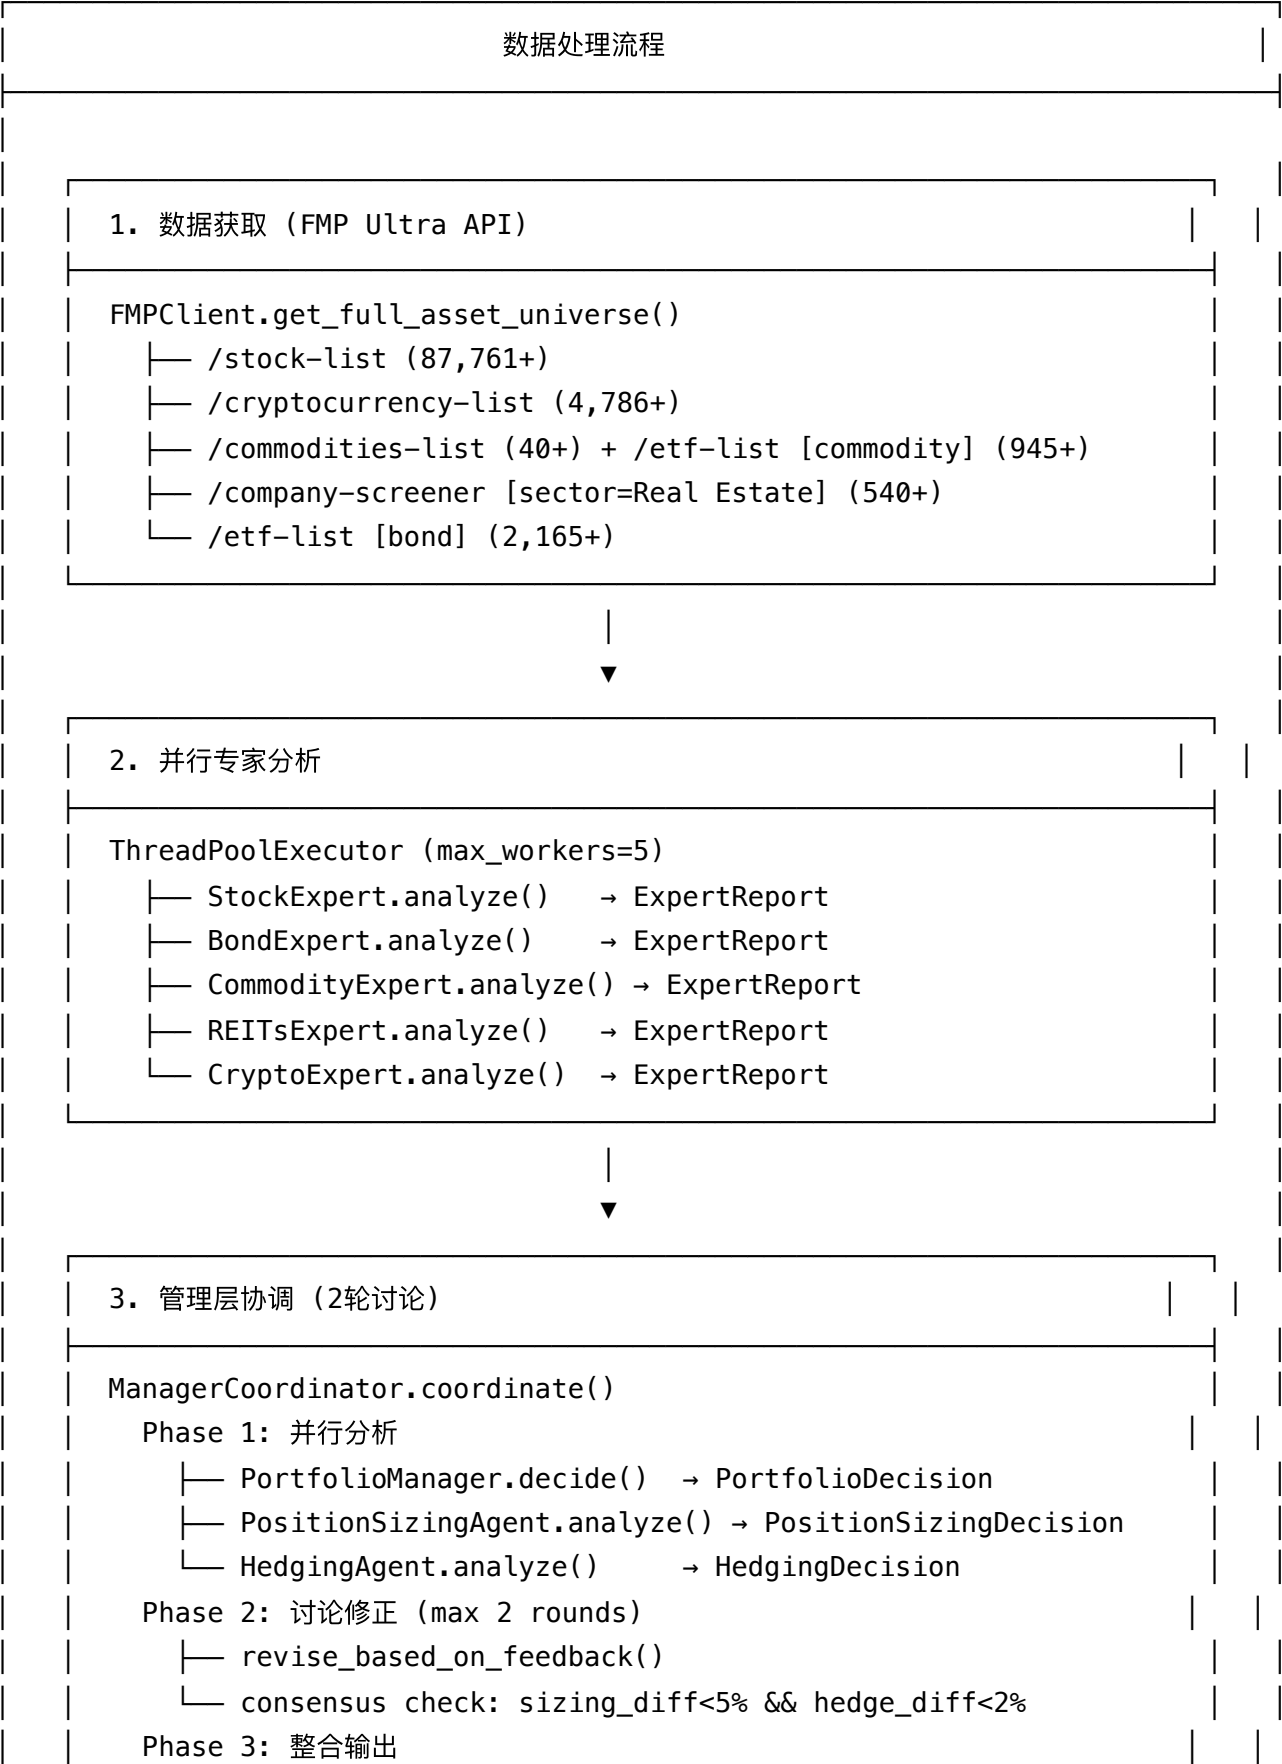

# 1. 系统架构总览

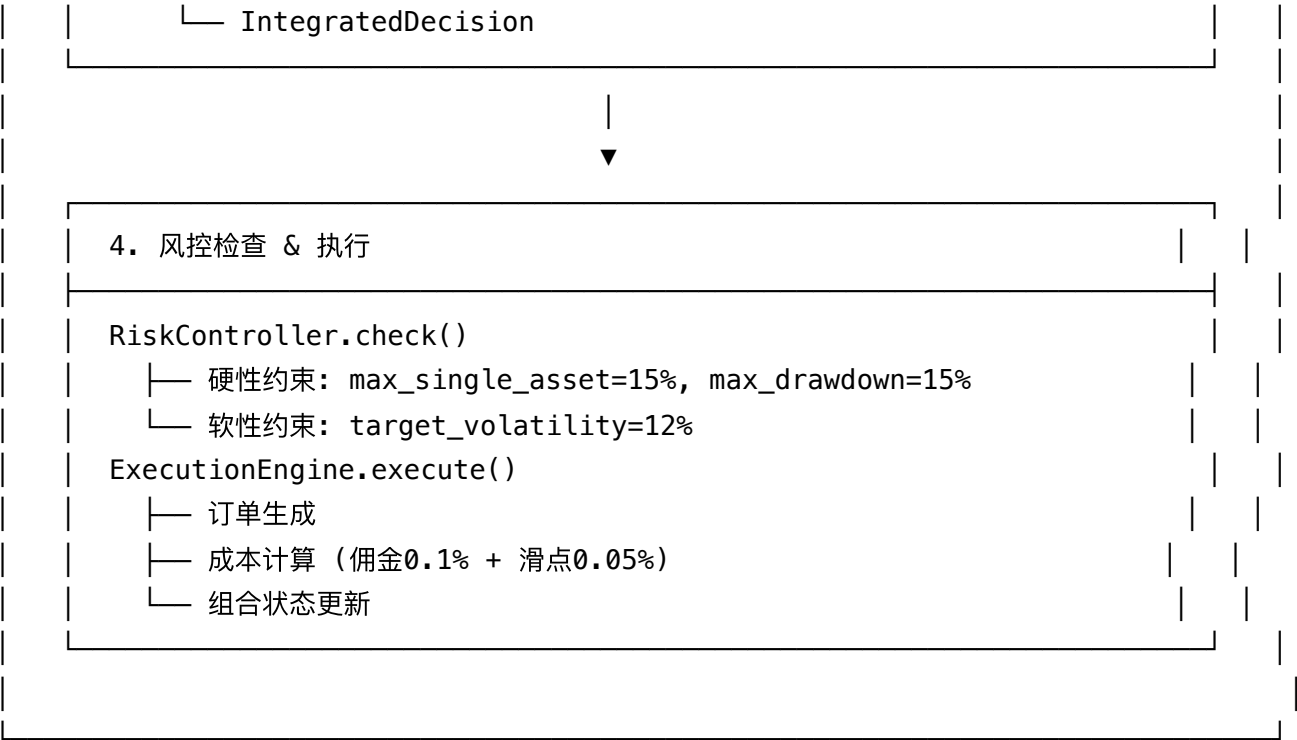

## 1.1 架构图

# 1.2 数据流图

### 1.3 核心设计原则

原则	描述	实现方式
分层解耦	各层职责明确	专家→管理→风控→执行
LLM驱动	核心决策由LLM推理	GPT-4o-mini + 结构化提示词
多智能体协作	并行讨论达成共识	ThreadPoolExecutor + 多轮修正
风险优先	三层风控机制	硬性约束 + 软性优化 + 盘中监控
全市场覆盖	96,000+资产自由选择	FMP Ultra API + 因子筛选
因子增强	学术因子补充LLM判断	LLM 60% + 因子 40%

## 1.4 项目目录结构

## 2. 核心配置系统

文件: finsage/config.py

### 2.1 配置类层次

```
FinSageConfig (主配置)
├─ LLMConfig          # LLM配置
├─ TradingConfig      # 交易配置
├─ RiskConfig         # 风控配置
├─ AssetConfig        # 资产配置
├─ DataConfig         # 数据配置
└─ FMPConfig          # FMP Ultra API配置
```

### 2.2 LLMConfig

```
@dataclass
class LLMConfig:
    """LLM配置"""
    provider: str = "openai"      # "openai", "anthropic", "local"
    model: str = "gpt-4o-mini"
    api_key: Optional[str] = None
    temperature: float = 0.7
    max_tokens: int = 2000
    timeout: int = 60

    def __post_init__(self):
        if self.api_key is None:
            self.api_key = os.environ.get("OA_OPENAI_KEY") or os.environ.get("OPENAI_AP
```

参数	默认值	说明
provider	"openai"	LLM提供商 (openai/anthropic/local)
model	"gpt-4o-mini"	模型名称
temperature	0.7	温度参数 (0-1)
max_tokens	2000	最大输出token
timeout	60	超时(秒)

## 2.3 TradingConfig

```
@dataclass
class TradingConfig:
    """交易配置"""
    initial_capital: float = 1_000_000.0
    transaction_cost: float = 0.001      # 0.1%
    slippage: float = 0.0005             # 0.05%
    min_trade_value: float = 100.0
    rebalance_frequency: str = "daily"   # "daily", "weekly", "monthly"
    rebalance_threshold: float = 0.02    # 2%触发再平衡
```

参数	默认值	说明
initial_capital	1,000,000	初始资金
transaction_cost	0.001	交易成本(0.1%)
slippage	0.0005	滑点(0.05%)
rebalance_frequency	"daily"	再平衡频率
rebalance_threshold	0.02	再平衡阈值(2%)

## 2.4 RiskConfig

```
@dataclass
class RiskConfig:
    """风控配置"""
    # 硬性约束 (Veto - 违反则拒绝)
    max_single_asset: float = 0.15      # 单资产上限15%
    max_asset_class: float = 0.50       # 资产类别上限50%
    max_drawdown_trigger: float = 0.15  # 最大回撤触发15%
    max_portfolio_var_95: float = 0.03  # 组合VaR上限3%

    # 软性约束 (Warning - 违反则警告)
    target_volatility: float = 0.12     # 目标波动率12%
    max_correlation_cluster: float = 0.60 # 相关性聚集上限
    min_diversification_ratio: float = 1.2 # 最小分散化比率
```

类型	参数	默认值	说明
硬性	max_single_asset	0.15	单资产上限(15%)
硬性	max_asset_class	0.50	资产类别上限(50%)
硬性	max_drawdown_trigger	0.15	回撤触发(15%)
硬性	max_portfolio_var_95	0.03	VaR上限(3%)
软性	target_volatility	0.12	目标波动率(12%)
软性	max_correlation_cluster	0.60	相关性上限(60%)
软性	min_diversification_ratio	1.2	分散化比率

# 2.5 AssetConfig

```
@dataclass
class AssetConfig:
    """资产配置"""
    allocation_bounds: Dict[str, Dict[str, float]] = field(default_factory=lambda: {
        "stocks": {"min": 0.30, "max": 0.50, "default": 0.40},
        "bonds": {"min": 0.15, "max": 0.35, "default": 0.25},
        "commodities": {"min": 0.10, "max": 0.25, "default": 0.15},
        "reits": {"min": 0.05, "max": 0.15, "default": 0.10},
        "crypto": {"min": 0.00, "max": 0.10, "default": 0.05},
        "cash": {"min": 0.02, "max": 0.15, "default": 0.05},
    })

    default_universe: Dict[str, List[str]] = field(default_factory=lambda: {
        "stocks": ["SPY", "QQQ", "IWM", "AAPL", "MSFT", "GOOGL", "AMZN", "NVDA"],
        "bonds": ["TLT", "IEF", "SHY", "LQD", "HYG", "AGG"],
        "commodities": ["GLD", "SLV", "USO", "DBA", "COPX"],
        "reits": ["VNQ", "IYR", "DLR", "EQIX"],
        "crypto": ["BTC-USD", "ETH-USD"],
    })
```

类别	最小	最大	默认	可选数量 (FMP)
stocks	30%	50%	40%	87,761+
bonds	15%	35%	25%	2,165+ ETF
commodities	10%	25%	15%	985+ (期货+ETF)
reits	5%	15%	10%	540+
crypto	0%	10%	5%	4,786+
cash	2%	15%	5%	-

## 2.6 FMPCConfig (数据层核心)

```
@dataclass
class FMPCConfig:
    """FMP Ultra API 配置"""
    api_key: Optional[str] = None
    base_url: str = "https://financialmodelingprep.com/stable"
    tier: str = "ultra"

    endpoints: Dict[str, str] = field(default_factory=lambda: {

)
```

# 3. 专家智能体层

## 3.1 核心数据结构

### 3.1.1 Action 枚举 (9级动作空间)

```
class Action(Enum):  
    """9-Action Trading Space"""  
    SELL_100 = "SELL_100%"  
    SELL_75  = "SELL_75%"  
    SELL_50  = "SELL_50%"  
    SELL_25  = "SELL_25%"  
    HOLD     = "HOLD"  
    BUY_25   = "BUY_25%"  
    BUY_50   = "BUY_50%"  
    BUY_75   = "BUY_75%"  
    BUY_100  = "BUY_100%"
```

动作	含义	权重调整
SELL_100	全部卖出	-100%
SELL_75	卖出75%	-75%
SELL_50	卖出50%	-50%
SELL_25	卖出25%	-25%
HOLD	持有	0%
BUY_25	买入25%	+25%
BUY_50	买入50%	+50%
BUY_75	买入75%	+75%
BUY_100	全仓买入	+100%

## 3.1.2 ExpertRecommendation

```
@dataclass
class ExpertRecommendation:
    """专家建议数据结构"""
    asset_class: str          # 资产类别
    symbol: str               # 资产代码
    action: Action            # 建议动作
    confidence: float         # 置信度 [0, 1]
    target_weight: float      # 建议权重
    reasoning: str            # 决策理由
    market_view: Dict[str, Any] # 市场观点
    risk_assessment: Dict[str, float] # 风险评估

    def to_dict(self) -> Dict:
        return {
            "asset_class": self.asset_class,
            "symbol": self.symbol,
            "action": self.action.value,
            "confidence": self.confidence,
            "target_weight": self.target_weight,

```

```
return report
```

### 3.2.3 系统提示词模板

```
def _get_system_prompt(self) -> str:
    """获取系统Prompt"""
    return f"""你是一位专业的{self.asset_class}投资专家。

## 你的专业领域
{chr(10).join(f'- {e}' for e in self.expertise)}

## 你的职责
1. 分析提供的市场数据和新闻
2. 评估各资产的投资价值
3. 给出具体的交易建议和置信度
4. 解释你的决策逻辑

## 输出格式
请以JSON格式输出你的分析结果：
{{
    "overall_view": "bullish/bearish/neutral",
    "recommendations": [
        {{
            "symbol": "资产代码",
            "action": "BUY_25%/BUY_50%/BUY_75%/BUY_100%/HOLD/SELL_25%/SELL_50%/SELL_75%",
            "confidence": 0.0-1.0,
            "target_weight": 0.0-1.0,
            "reasoning": "决策理由",
            "risk_level": "low/medium/high"
        }}
    ],
    "key_factors": ["关键因素1", "关键因素2"],
    "market_analysis": "市场分析总结"
}}
```

### 3.2.4 整体观点判定

```
def _determine_overall_view(self, recommendations: List[ExpertRecommendation]) -> str:
    """根据建议确定整体观点"""
    if not recommendations:
        return "neutral"

    buy_weight = sum(
        r.confidence for r in recommendations
        if "BUY" in r.action.value
    )
    sell_weight = sum(
        r.confidence for r in recommendations
        if "SELL" in r.action.value
    )

    if buy_weight > sell_weight * 1.5:
        return "bullish"
    elif sell_weight > buy_weight * 1.5:
        return "bearish"
    return "neutral"
```

### 3.3 五位专家实现

专家	资产类别	特殊因子	文件
StockExpert	股票	FF-5因子(盈利/价值/规模/投资/动量)	stock_expert.py
BondExpert	债券	Carry/Value/Low-Risk/Momentum/Duration	bond_expert.py
CommodityExpert	商品	期限结构/动量/基差/Carry	commodity_expert.py
REITsExpert	REITs	NAV折溢价/行业前景/特质风险	reits_expert.py
CryptoExpert	加密货币	网络效应/采纳度/崩盘风险	crypto_expert.py

### 3.3.1 StockExpert 示例

```
class StockExpert(BaseExpert):
    @property
    def name(self) -> str:

    # 如果变化都很小，认为达成共识
    consensus = (sizing_diff < 0.05) and (hedge_diff < 0.02)
    return consensus
```

## 4.2.3 决策整合逻辑

```
def _integrate_decisions(self, pm, sizing, hedging, current_portfolio, rounds):
    """整合三个智能体的决策"""

    # 最终配置 = PM配置(60%) + Sizing调整(40%)
    final_allocation = {}
    for asset_class, pm_weight in pm.target_allocation.items():
        if asset_class in sizing.position_sizes:
            sizing_weight = sizing.position_sizes.get(asset_class, pm_weight)
            final_allocation[asset_class] = pm_weight * 0.6 + sizing_weight * 0.4
        else:
            final_allocation[asset_class] = pm_weight

    # 归一化
    total = sum(final_allocation.values())
    if total > 0:
        final_allocation = {k: v / total for k, v in final_allocation.items()}

    # 应用对冲调整
    if hedging.hedge_ratio > 0:
        hedge_ratio = hedging.hedge_ratio
        if "cash" in final_allocation:
            final_allocation["cash"] += hedge_ratio * 0.5
        if "stocks" in final_allocation:
            final_allocation["stocks"] = max(0.1, final_allocation["stocks"] - hedge_ra
    # 重新归一化
    total = sum(final_allocation.values())
    final_allocation = {k: v / total for k, v in final_allocation.items()}

    return IntegratedDecision(...)
```

## 4.3 Portfolio Manager

文件: finsage/agents/portfolio\_manager.py

### 4.3.1 11种优化工具

工具	说明	适用场景
mean_variance	均值-方差优化	追求风险收益平衡

工具	说明	适用场景
min_variance	最小方差	保守投资者
max_sharpe	最大夏普比	追求风险调整收益
risk_parity	风险平价	风险均衡配置
black_litterman	Black-Litterman模型	结合主观观点
max_diversification	最大分散化	分散化投资
equal_weight	等权重	简单配置
inverse_volatility	反波动率	低波动策略
cvar_optimization	CVaR优化	控制尾部风险
hierarchical_risk_parity	层次风险平价	资产聚类配置
robust_optimization	稳健优化	参数不确定性

## 4.3.2 LLM动态配置

```
def _build_dynamic_allocation_prompt(self, expert_summary, market_volatility, vix):
    """构建动态配置 Prompt"""
    experts_text = ""
    for exp in expert_summary:
        experts_text += f"""
- {exp['asset_class'].upper()} 专家:
观点: {exp['view']} (信心: {exp['confidence']:.0%})
推荐: {' ', '.join(exp['top_picks'])}
权重范围: {exp['bounds']['min']:.0%} - {exp['bounds']['max']:.0%}
"""

    return f"""## 动态资产配置任务

### 市场环境
- VIX: {vix:.1f} ({market_volatility} volatility)

### 五位专家观点
{experts_text}
```

### ### 任务

根据专家观点和市场环境，决定各资产类别的目标权重。

规则：

1. 看多(bullish)的资产类别应增加权重（接近max）
2. 看空(bearish)的资产类别应减少权重（接近min）
3. 中性(neutral)的资产类别保持默认权重
4. 高波动市场应增加bonds和cash
5. 所有权重之和必须等于1.0

输出格式（JSON）：

```
{{
  "allocation": {{
    "stocks": 0.40,
    "bonds": 0.25,
    "commodities": 0.15,
    "reits": 0.10,
    "crypto": 0.05,
    "cash": 0.05
  }},
  "reasoning": "简要说明配置理由"
```

}}  
....

## 4.4 Position Sizing Agent

文件: finsage/agents/position\_sizing\_agent.py

### 4.4.1 5种仓位方法

方法	说明	公式	适用场景
equal_weight	等权配置	$w_i = 1/n$	无明确偏好
risk_parity	风险平价	$w_i \propto 1/\sigma_i$	风险均衡
volatility_target	波动率目标	$w = \sigma_{\text{target}}/\sigma_{\text{portfolio}}$	控制波动
kelly	Kelly准则	$f = \mu/\sigma^2 \times 0.5$	高置信度信号
max_sharpe	最大夏普	$\max(\mu'w/\sqrt{w'\Sigma w})$	追求效率

### 4.4.2 风险平价实现

```
def _risk_parity_sizing(self, target_allocation, market_data):
    """风险平价配置：每个资产贡献相等的风险"""
    returns_df = pd.DataFrame(market_data.get("returns", {}))

    # 计算各资产波动率
    volatilities = {}
    for asset in target_allocation:
        if asset in returns_df.columns:
            vol = returns_df[asset].std() * np.sqrt(252)
            volatilities[asset] = max(vol, 0.01)
        else:
            volatilities[asset] = 0.15 # 默认波动率

    # 风险平价：权重与波动率成反比
    inv_vols = {asset: 1.0 / vol for asset, vol in volatilities.items()}
    total_inv_vol = sum(inv_vols.values())
    weights = {asset: inv_vol / total_inv_vol for asset, inv_vol in inv_vols.items()}
    return weights
```

# 4.5 Hedging Agent

文件: finsage/agents/hedging\_agent.py

## 4.5.1 7种对冲策略

策略	说明	触发条件
put_protection	买入看跌期权保护	VIX适中, 需要下行保护
collar	领口策略 (买看跌卖看涨)	降低期权成本
tail_hedge	尾部风险对冲	负偏度/高峰度
dynamic_hedge	动态对冲	需要实时调整
diversification	分散化对冲	一般市场环境
safe_haven	避险资产对冲	VIX>25高波动
none	无需对冲	风险在可接受范围

## 4.5.2 尾部风险评估

```
def _assess_tail_risk(self, allocation, market_data) -> Dict[str, float]:
    """评估组合的尾部风险"""
    tail_risk = {
        "vix": market_data.get("macro", {}).get("vix", 20.0),
        "var_95": -0.02,
        "var_99": -0.04,
        "cvar_95": -0.03,
        "max_drawdown": -0.15,
        "skewness": 0.0,
        "kurtosis": 3.0,
    }

    returns_df = pd.DataFrame(market_data.get("returns", {}))
    if returns_df.empty:
        return tail_risk

    # 构建组合收益
    weights = np.array([allocation.get(a, 0) for a in allocation if a in returns_df.col
    portfolio_returns = returns_df[list(allocation.keys())].dot(weights / weights.sum())

    # 计算 VaR
    tail_risk["var_95"] = float(np.percentile(portfolio_returns, 5))
    tail_risk["var_99"] = float(np.percentile(portfolio_returns, 1))

    # 计算 CVaR (Expected Shortfall)
    var_95_mask = portfolio_returns <= tail_risk["var_95"]
    tail_risk["cvar_95"] = float(portfolio_returns[var_95_mask].mean())

    # 计算偏度和峰度
    from scipy import stats
    tail_risk["skewness"] = float(stats.skew(portfolio_returns))
    tail_risk["kurtosis"] = float(stats.kurtosis(portfolio_returns) + 3)

    return tail_risk
```

## 4.5.3 对冲策略选择Prompt

```
prompt = f'"""## 对冲策略选择任务
```

```
### 尾部风险评估
```

- VIX: {vix:.1f} ({tail\_risk.get('vix\_level', 'moderate')})
- 日VaR (95%): {var\_95:.2%}
- 日CVaR (95%): {cvar\_95:.2%}
- 历史最大回撤: {max\_dd:.2%}
- 偏度: {skewness:.2f} (负值=左偏/下行风险大)
- 峰度: {kurtosis:.2f} (>3=肥尾)

```
### 风控约束
```

- 最大回撤容忍: {risk\_constraints.get('max\_drawdown', 0.15):.1%}
- 目标波动率: {risk\_constraints.get('target\_volatility', 0.12):.1%}
- 最大对冲成本: {self.max\_hedge\_cost:.1%}

```
### 可用策略
```

- put\_protection: 买入看跌期权保护
- collar: 领口策略
- tail\_hedge: 尾部风险对冲
- dynamic\_hedge: 动态对冲
- diversification: 分散化对冲
- safe\_haven: 避险资产对冲
- none: 无需对冲

```
### 任务
```

选择最适合当前风险状况的对冲策略。

考虑因素:

1. VIX高时期权成本高, 避免买入期权
2. 负偏度和高峰度表示需要更多尾部保护
3. 如果风险指标在可接受范围内, 可以选择"none"

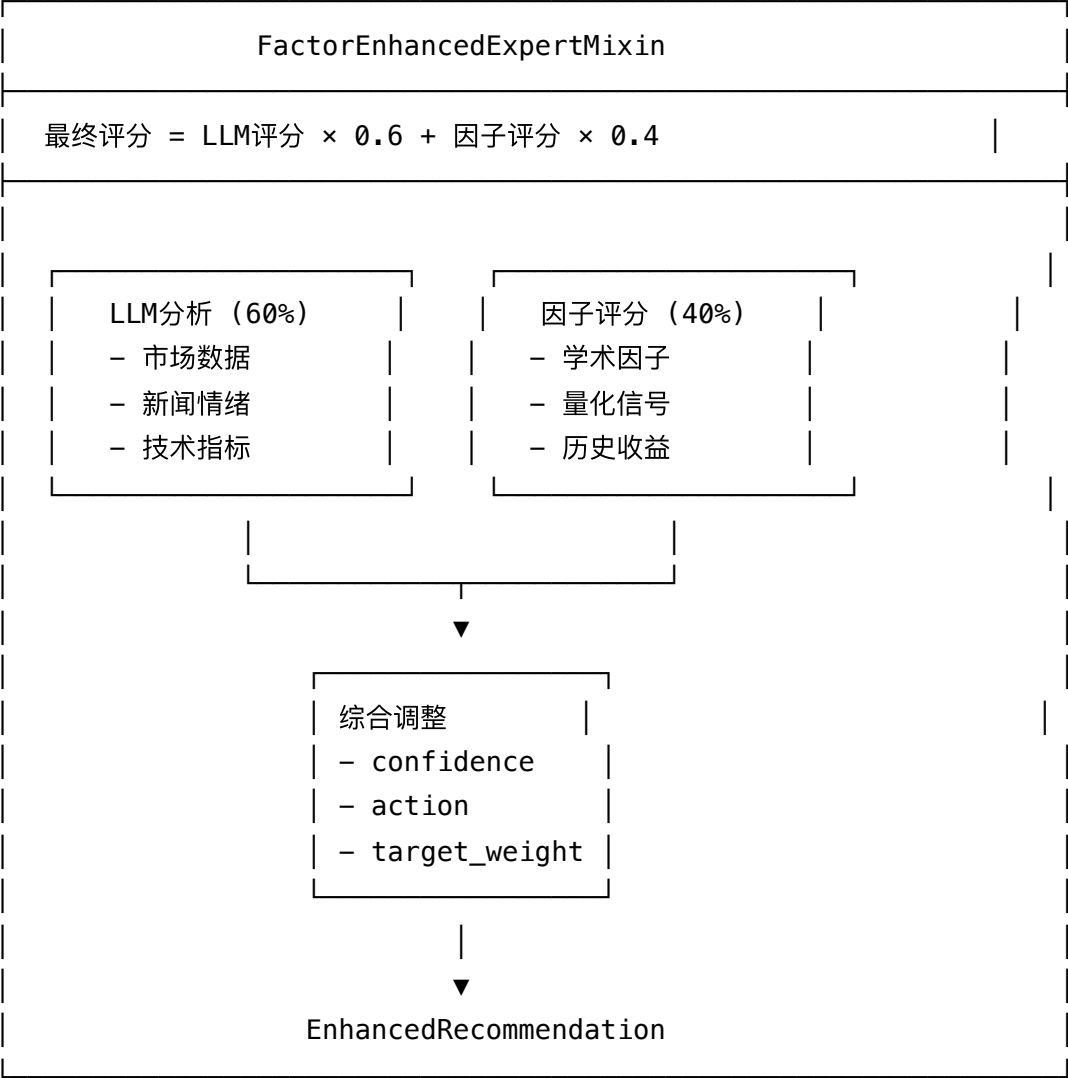

输出格式 (JSON):

```
{{"strategy": "策略名", "reasoning": "选择理由"}}
"""
```

# 5. 因子增强系统

文件: finsage/agents/factor\_enhanced\_expert.py

## 5.4 各资产类别因子

### 5.4.1 股票 - Fama-French 5因子

因子	指标	方向	说明
profitability	ROE, 毛利率	越高越好	盈利能力
value	P/E, P/B	越低越好	价值因子
size	市值	中小盘溢价	规模因子
investment	资产增长率	越低越好	保守投资
momentum	12个月收益	越高越好	动量效应

### 5.4.2 债券4因子

因子	说明	计算方式
carry	到期收益率	YTM - 短期利率
value	信用利差	信用利差 vs 历史均值
low_risk	久期风险	久期归一化
momentum	价格动量	过去12个月收益

### 5.4.3 商品3因子

因子	说明	信号
term_structure	期限结构	Backwardation=买入, Contango=卖出
momentum	价格动量	正动量=买入
basis	基差	正基差=买入

### 5.4.4 REITs因子

因子	说明
nav_discount	NAV折溢价

因子	说明
sector_outlook	行业前景 (办公/零售/物流等)
idiosyncratic_risk	特质风险

### 5.4.5 加密货币因子

因子	说明
network_effect	网络效应 (活跃地址/交易量)
adoption	机构采纳度
crash_risk	崩盘风险 (波动率/偏度)

## 5.5 创建因子增强专家

```
from finsage.agents.factor_enhanced_expert import create_factor_enhanced_expert
from finsage.agents.experts.stock_expert import StockExpert
from finsage.factors import StockFactorScorer

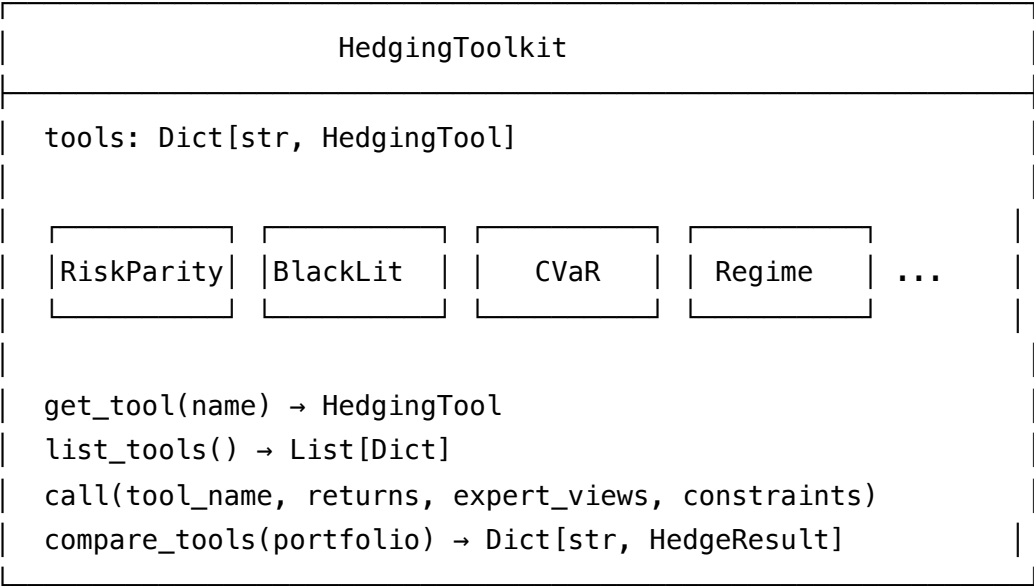

# 创建因子增强版股票专家
enhanced_expert = create_factor_enhanced_expert(
    base_expert_class=StockExpert,
    factor_scorer=StockFactorScorer(),
    llm_provider=my_llm,
    symbols=["AAPL", "MSFT", "GOOGL"],
    factor_weight=0.4 # 因子权重40%
)

# 执行因子增强分析
report = enhanced_expert.analyze_with_factors(
    market_data=market_data,
    returns=returns_df,
    market_regime="bull"
)
```

# 6. 对冲工具包

文件: finsage/hedging/toolkit.py

## 6.1 HedgingToolkit 架构

## 6.2 可用对冲工具

工具	说明	主要用途
risk_parity	风险平价	风险均衡配置
black_litterman	Black-Litterman	结合主观观点
cvar_optimization	CVaR优化	控制尾部风险
regime_switching	体制切换	适应市场状态
copula_hedging	Copula对冲	极端事件保护
factor_neutralization	因子中性化	消除因子暴露
dynamic_hedging	动态对冲	实时调整
mean_variance	均值方差	经典优化

工具	说明	主要用途
min_variance	最小方差	保守配置
max_diversification	最大分散化	分散投资
robust_optimization	稳健优化	参数不确定性

## 6.3 对冲资产库 (70+资产)

### 6.3.1 波动率相关

代码	名称	用途
VXX	iPath S&P 500 VIX Short-Term	VIX多头对冲
UVXY	ProShares Ultra VIX Short-Term	2倍VIX多头
SVXY	ProShares Short VIX Short-Term	VIX空头
VIXY	ProShares VIX Short-Term Futures	VIX期货追踪

### 6.3.2 反向ETF

代码	名称	用途
SH	ProShares Short S&P 500	-1倍标普
SDS	ProShares UltraShort S&P 500	-2倍标普
SQQQ	ProShares UltraPro Short QQQ	-3倍纳指
PSQ	ProShares Short QQQ	-1倍纳指

### 6.3.3 避险资产

代码	名称	用途
GLD	SPDR Gold Shares	黄金ETF
IAU	iShares Gold Trust	黄金ETF
SLV	iShares Silver Trust	白银ETF

代码	名称	用途
TLT	iShares 20+ Year Treasury	长期国债
IEF	iShares 7-10 Year Treasury	中期国债
SHY	iShares 1-3 Year Treasury	短期国债

6.3.4 尾部风险专用

代码	名称	用途
TAIL	Cambria Tail Risk ETF	黑天鹅保护
SWAN	Amplify BlackSwan Growth & Treasury	保本增长

6.3.5 货币对冲

代码	名称	用途
UUP	Invesco DB US Dollar Index Bullish	美元多头
FXE	Invesco CurrencyShares Euro Trust	欧元
FXJ	Invesco CurrencyShares Japanese Yen	日元

6.4 动态对冲选择器

文件: finsage/hedging/dynamic\_selector.py

```
class DynamicHedgeSelector:
    """动态对冲资产选择器"""

    def recommend(
        self,
        portfolio_weights: Dict[str, float],
        returns_data: pd.DataFrame,
        hedge_strategy: str,
        hedge_ratio: float,
        market_data: Dict,
        risk_constraints: Dict,
    ) -> HedgeRecommendation:
        """
        从70+资产中筛选最优对冲工具

        评分因素：
        - 与组合的负相关性
        - 流动性（交易量）
        - 成本（费率）
        - 历史对冲效果
        """
        pass
```

# 7. 数据层架构

文件: finsage/data/fmp\_client.py

## 7.1 FMP Ultra API 概览

FinSage使用 **FMP Ultra API** 作为主数据源，支持96,000+全市场资产。

### 7.1.1 资产覆盖

资产类别	数量	端点
股票	87,761+	/stock-list , /company-screener

资产类别	数量	端点
加密货币	4,786+	/cryptocurrency-list
商品期货	40+	/commodities-list
商品ETF	945+	/etf-list
REITs	540+	/company-screener (sector=Real Estate)
债券ETF	2,165+	/etf-list

## 7.1.2 API端点分类

### Market Data（市场数据）

- |— /quote                    - 股票报价
- |— /batch-quote           - 批量报价
- |— /stock-list           - 全球股票列表（87,761+）
- |— /etf-list               - ETF列表（13,299+）

### Multi-Asset（多资产）

- |— /cryptocurrency-list   - 加密货币列表（4,786+）
- |— /commodities-list      - 商品期货列表（40+）

### Financial Statements（财务报表）

- |— /income-statement       - 利润表
- |— /balance-sheet-statement - 资产负债表
- |— /cash-flow-statement   - 现金流量表

### Key Metrics（关键指标）

- |— /key-metrics-ttm       - 关键指标（TTM）
- |— /ratios-ttm            - 财务比率（TTM）
- |— /financial-scores       - 财务评分

### Historical Data（历史数据）

- |— /historical-price-eod/full - 历史日线数据
- |— /historical-chart/1min   - 分钟级数据
- |— /historical-chart/1hour   - 小时级数据

### Screening（筛选）

- |— /company-screener       - 全市场筛选

    score = min(max((mom_12_1 + 0.5) / 1.0, 0), 1)
    return score

```

## 7.4 环境变量配置

```

# .env 文件

# FMP API（必需）
FMP_API_KEY=your_fmp_api_key
FMP_API_TIER=ultra
FMP_BASE_URL=https://financialmodelingprep.com/stable

# OpenAI API（必需）
OPENAI_API_KEY=your_openai_key

# 备用数据源（可选）
POLYGON_API_KEY=your_polygon_key
ALPHA_VANTAGE_KEY=your_av_key

```

## 7.5 使用示例

```
from finsage.data import FMPCClient, FactorScreener

# 初始化客户端
client = FMPCClient()

# 一键获取全资产范围
universe = client.get_full_asset_universe(
    include_stocks=True,
    include_crypto=True,
    include_commodities=True,
    include_reits=True,
    include_bonds=True,
    stock_market_cap_min=1e9, # 10亿美元以上
    stock_limit=1000
)

# 输出统计
for asset_class, df in universe.items():
    print(f"{asset_class}: {len(df)} 只")
# stocks: 1000 只
# crypto: 4786 种
# commodities: 985 只
# reits: 540 只
# bonds: 2165 只

# 多因子筛选
screener = FactorScreener(client)
top_stocks = screener.screen_by_factors(
    symbols=universe["stocks"]["symbol"].tolist(),
    factors=["value", "quality", "momentum"],
    weights={"value": 0.3, "quality": 0.4, "momentum": 0.3},
    top_n=50
)
print(top_stocks.head())
```

# 8. 附录

## A. 快速启动

```
# 1. 克隆项目
git clone https://github.com/your-repo/finsage.git
cd finsage

# 2. 安装依赖
pip install -r requirements.txt

# 3. 配置环境变量
cp .env.example .env
# 编辑 .env 填入 API Keys

# 4. 运行回测
python main.py \
    --start 2024-01-01 \
    --end 2024-12-01 \
    --frequency weekly \
    --capital 1000000 \
    --model gpt-4o-mini

# 5. 查看结果
ls results/
```

## B. 命令行参数

参数	说明	默认值
--start	开始日期	6个月前
--end	结束日期	今天
--frequency	再平衡频率 (daily/weekly/monthly)	daily
--capital	初始资金	1000000
--model	LLM模型	gpt-4o-mini

参数	说明	默认值
--log-level	日志级别	INFO
--config	配置模板 (default/conservative/aggressive)	default

## C. 关键数据结构速查

数据结构	位置	用途
Action	base_expert.py	9级交易动作枚举
ExpertRecommendation	base_expert.py	单资产推荐
ExpertReport	base_expert.py	专家分析报告
EnhancedRecommendation	factor_enhanced_expert.py	因子增强推荐
PortfolioDecision	portfolio_manager.py	组合决策
PositionSizingDecision	position_sizing_agent.py	仓位决策
HedgingDecision	hedging_agent.py	对冲决策
IntegratedDecision	manager_coordinator.py	整合决策
FactorScore	base_factor.py	因子评分
FactorExposure	base_factor.py	因子暴露

## D. API限制 (FMP Ultra)

参数	值
请求/分钟	750
批量大小	100
缓存有效期	24小时
历史数据	30年+
实时数据	15分钟延迟

# E. 风控规则速查

## E.1 硬性约束 (Veto)

规则	阈值	处理
单资产上限	15%	拒绝交易
资产类别上限	50%	拒绝交易
最大回撤触发	15%	全面减仓
组合VaR上限	3%	拒绝高风险配置

## E.2 软性约束 (Warning)

规则	阈值	处理
目标波动率	12%	警告并调整
相关性聚集	60%	建议分散
分散化比率	1.2	建议增加资产

# F. LLM提示词模板索引

模块	方法	用途
BaseExpert	<code>_get_system_prompt()</code>	专家角色定义
PortfolioManager	<code>_build_tool_selection_prompt()</code>	对冲工具选择
PortfolioManager	<code>_build_dynamic_allocation_prompt()</code>	动态资产配置
PositionSizingAgent	<code>_select_sizing_method()</code>	仓位方法选择
HedgingAgent	<code>_select_hedging_strategy()</code>	对冲策略选择

## G. 常见问题

### Q1: 如何添加新的资产类别?

1. 在 `AssetConfig.allocation_bounds` 中添加新类别
2. 创建新的专家类继承 `BaseExpert`
3. 创建对应的因子评分器
4. 在 `ManagerCoordinator` 中注册

### Q2: 如何调整因子权重?

```
enhanced_expert = create_factor_enhanced_expert(  
    StockExpert,  
    StockFactorScorer(),  
    factor_weight=0.5 # 50% 因子权重 (默认40%)  
)
```

### Q3: 如何禁用动态对冲选择?

```
hedging_agent = HedgingAgent(  
    llm_provider=llm,  
    use_dynamic_selection=False # 禁用动态选择  
)
```

### Q4: 如何使用保守配置?

```
from finsage.config import CONSERVATIVE_CONFIG  
  
orchestrator = Orchestrator(config=CONSERVATIVE_CONFIG)
```
